Fyxee Assignment (Backend)

As a backend developer, we deal with building REST APIs for web apps or mobile apps. REST APIs are one of the most common web services available today. They allow various clients including browser apps to communicate with a server via the REST API.

Design the backend of a TO-DO application with the help of REST APIs. The application will handle the following use cases:
- Create a task
- Edit a task
- Remove a task
- Update a task

A single task will have the following fields:
- Heading
- Description
- Status (Done/Pending)
- Created date
- Last edited date
- Target date (date on which the task is assigned to be over)

Design the application with your choice's language, framework, and database. Push the code into your repository on GitHub and share it.

Brownie points:
- Containerize the application using Docker (optional)
